Preface	v
References for Preface	xi
1 Overview of the Science of Forms	1
1.1 What is the Science of Forms?	3
Sciences in Edo era	3
Sciences in 20th century—Terada physics	5
Tetrahedron of groups of fields	8
1.2 Historical Landmarks in Science of Forms in the World	9
Platonic bodies	9
Kepler’s cosmic model	10
Euler index and topology	12
Wegener’s theory of continental drift	13
Watson and Crick’s DNA model	14
Concept of fractal by Mandelbrot	16
Discovery of quasi-crystal by Schechtman	18
1.3 Terminology of Forms	19
Shape, form and Katachi	19
Pattern and Kata	20
Eidos and Morphe	21
Symmetry	22
Art and design	24
References for Chapter 1	26
2 Properties of Space	29
2.1 Symmetry and Crystallography	31
Symmetries of various kinds	31
Frieze patterns	32
2D lattices and wall paper patterns	33
Real crystal structures	36
2.2 Tiling and Space Division	39
Tiling of regular polygons	40
Hexagon tiling in nature	41
Voronoi tessellation and territory patterns	42
Some other interesting tilings	44
Statistics of polygon tiling in a plane	46
Division of spherical surface	48
2.3 Division of 3D Space	49
Close packing of equal spheres	49
Kelvin’s problem	53
Federov’s parallel polyhedra	56
Other interesting topics	59

2.4	Quasicrystal and Its Models	61
	Concept of quasicrystal and reciprocal lattice	61
	Models of quasicrystal—Fibonacci lattice	63
	Models of quasicrystal—Penrose tiling	64
	Models of quasicrystal—Watanabe tiling	67
	Models of quasicrystal—3D Penrose tiling	68
2.5	Spatial Curves and Rope Patterns	70
	Frenet-Serret formula	70
	Shapes of ropes and rope patterns	72
	References for Chapter 2	77
3	Mechanism of Pattern Formation	81
3.1	Energy Principle—Forms by Stable Force Balance	83
	Variational method	83
	Slope for minimum falling time	86
	Catenary curve	87
	Minimal surface	90
	Shapes of liquid drop	95
	Elastica	97
	Wulff's theorem for crystal shapes	100
	Ice crystal	102
	Effect of internal energy	103
3.2	Principle of Minimum Entropy Production—Patterns in Non-equilibrium States	105
	Kirchhoff's law and principle of minimum heat production	106
	Stationary diffusion of material	107
	Stationary heat conduction	109
	Principles for slow viscous flow	110
	Equations governing non-stationary irreversible processes	112
	Fokker-Planck equation and Ginzburg-Landau equation	113
3.3	Instability and Pattern Formation by Mode Selection	116
	Thermal convection	116
	General formulation of stability analysis	118
	Linear stability analysis of Rayleigh-Bénard convection	120
	Nonlinear analysis of Rayleigh-Bénard convection	123
	A variational principle for Rayleigh-Bénard convection	126
	Variational principle for mode selection problems	127
	Statistical physics of mode selection	131
	A peculiar case of mode selection	133
3.4	Principles for Growing Forms	134
	Diffusion limited aggregation	135
	Growth of snow flake	139
	Morphological stability of ice crystal	143
	Viscous fingering	148

3.5	Network Formation through Connection	151
	Horton's law for river streams	152
	Horton's law in systems other than the river stream	156
	Percolation as network formation	158
	Critical state in thermodynamics	162
	Critical state in an inequilibrium condition	166
3.6	Surface Tension Dynamics	169
	Dynamical effects of surface tension	169
	Instability of a liquid column	170
	Vibration of a spherical drop	172
	Appendices of Chapter 3	176
	References for Chapter 3	186
4	Nonlinear Dynamics and Randomness	191
4.1	Nonlinear and Deterministic Processes	193
	What is the nonlinearity?	193
	Shock wave based on Burgers equation	196
	Water waves and soliton	198
	Impact of the discovery of chaos	206
4.2	Discussion on the Irreversibility of Phenomena	212
	Reversibility of basic equations	212
	The second law of thermodynamics and the H -theorem	214
	Poincare's recurrence theorem	216
	Information contraction by projection operator	218
	About the concept of randomness	221
4.3	Turbulence and Coherent Structures	222
	Reynolds' experiment of transition to turbulence	222
	Linear stability theory	224
	Weakly nonlinear theory and transition to turbulence	227
	Statistical treatment of turbulence	234
	Theory of homogeneous and isotropic turbulence	237
	Coherent structure of turbulence	241
	Fluidized bed as a complex system	249
4.4	Vortex Dynamics—Dynamics of Singularities	253
	What is vortex?	253
	Conserved quantities in vortex dynamics	255
	Various dynamics of vortex motions	258
	Dynamics of a single vortex filament	259
	Entanglement of two vortex filaments	262
	Reconnection of two vortex filaments	266
	Dynamics of line singularities in other materials	272
4.5	Nonlinear Phenomena in Surface Tension Dynamics	276
	Self-induced vibration of a superheated drop	276
	Theoretical analysis of the drop vibration	280

Wave on an interface with chemical reaction	285
Mechanism of self-excited wave on the interface	287
Appendices of Chapter 4	292
References for Chapter 4	311
5 Mathematical Modeling of Biological Systems	317
5.1 Many Aspects of Biological Studies	319
Peculiarity of biological systems	319
Morphological studies of biological systems	320
Roles of physical and chemical effects	323
Importance of information	324
Problem of size	325
Relations to technology	328
5.2 Phyllotaxis and Fibonacci Numbers	330
2/5 phyllotaxis	331
Golden ratio phyllotaxis and pineapple flowers	332
Golden ratio phyllotaxis and sunflower spirals	334
5.3 Branching Systems of Blood Vessel and Airway	338
Branching rules of blood vessels	338
Reconstruction of human airway system	340
Reconstruction of blood vessels in liver	344
5.4 Mathematical Modeling of Morphogenesis	348
Turing's theory of morphogenesis	348
Applications of Turing's mathematical model	351
Application of reaction-diffusion equation to BZ reaction	354
Morphogenesis through change of cell shapes	355
Appendices of Chapter 5	357
References for Chapter 5	360
Epilog	365
Index	367
